ABL TASKS

Task 1: Personal Portfolio Website (Luffy Portfolio)

AIM

To design and implement a personalized portfolio website using HTML and CSS that displays student profile information, educational background, hobbies, technical skills, projects, achievements, and contact details with smooth navigation and CSS animation effects.

PROCEDURE

- **HTML Structure Definition:** Built the webpage layout using semantic tags including `<header>`, `<nav>`, multiple `<section>` containers with specific IDs (`#home`, `#about`, `#skills`, `#projects`, `#contact`), and a `<footer>`.
- **Navigation Link Setup:** Inserted navigation hyperlinks inside the black navigation bar to enable quick section scrolling.
- **Content Sectioning:** Grouped personal bio details, educational qualification, technical skills list, personal project details, resume background, and contact details within their respective HTML section blocks.
- **CSS Animation & Styling:** Linked an external CSS file (`styleoo.css`) to configure central text alignment, navy blue footer backgrounds, custom heading colors, smooth fade-in animations on sections using CSS `@keyframes`, and media queries for mobile screen layout adjustment.

CODE EXPLANATION

The solution consists of two primary components:

- **HTML Document (index.html):** Establishes the main document framework. The header section displays a top welcome banner. The navigation bar links directly to internal section targets. Content blocks highlight student profile information (Name, Branch, College), education details, hobbies list, technical proficiency (HTML, CSS, Python, C), project descriptions, achievements summary, contact links, and footer information.
- **CSS Stylesheet (styleoo.css):** Handles all visual enhancements. It applies global font formatting and center alignment across the entire page body, colors the header light blue, styles navigation bar anchor links with hover color transformations, introduces a 1-second keyframe opacity animation (`@keyframes fade`) on section loading, and implements responsive media rules to display navigation items as block elements on small screen viewports.

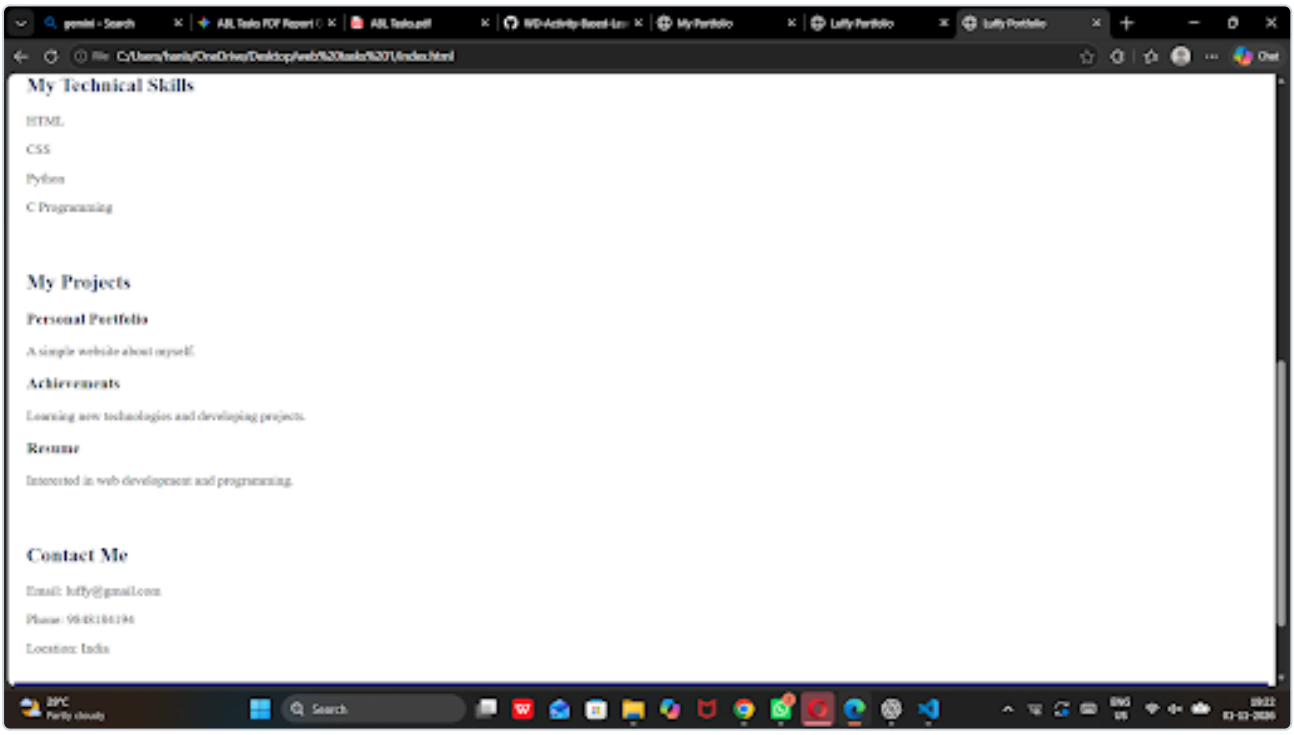

Figure 1.2: Technical Skills, Projects, Achievements, and Contact Information

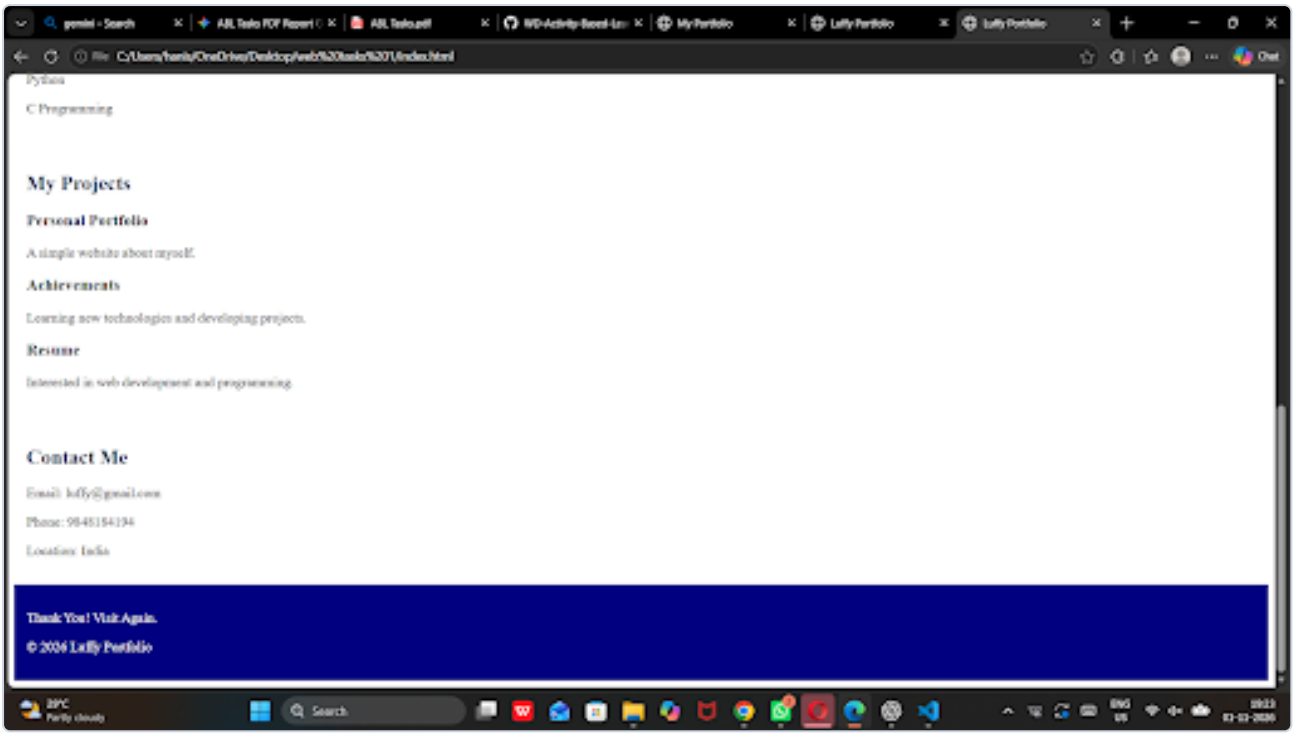

Figure 1.3: Projects, Resume, Contact Me Section, and Footer

Task 2: College Information Web Page

AIM

To create an informative web page for a college using HTML and CSS, featuring structured sections for college background, offered courses, facility listings, images, contact information, and customized header and footer styling.

PROCEDURE

- **HTML Structure Setup:** Structured the webpage using essential HTML elements like `<header>`, `<div>` blocks, unordered lists (`<ul>`), ordered lists (`<ol>`), image tags (`<img>`), and a `<footer>`.
- **Content Organization:** Separated distinct details such as college information, offered engineering streams, facilities, building image, and contact details into individual block containers.
- **Styling Implementation:** Connected an external CSS stylesheet to style the header with a blue background and centered text, format heading text colors, adjust global page fonts, and apply consistent footer formatting across the page.

CODE EXPLANATION

The web page implementation consists of two core files:

- **HTML File (2.html):** Serves as the primary content structure. It starts with a prominent header declaring the college name. The body contains individual section blocks containing descriptions, an unordered list detailing academic branches, an ordered list numbering facilities, an embedded image displaying the campus building, contact details, and a footer section containing copyright details.
- **CSS File (style2.css):** Controls visual layout rules. It establishes default page margins and font styling, applies background colors and text alignments to header and footer components, sets color themes for section titles (<h2>), and formats navigation hyperlink states.

Task 3: My Restaurant Website

AIM

To design and implement a responsive restaurant website landing page using HTML and CSS, showcasing a food menu with item images and pricing, a table reservation booking form, navigation links, and customized theme styling.

PROCEDURE

- **HTML Page Layout:** Formatted the structure using essential tags such as `<h1>`, `<nav>`, `<div>` sections with unique IDs (`#home`, `#menu`, `#contact`), food item images (`<img>`), form inputs (`<input>`), and a `<footer>`.
- **Interactive Sections & Booking Form:** Added navigation links pointing to respective page anchors and built a booking table section with name text input, date picker, and a call-to-action submit button.
- **CSS Customization:** Linked an external CSS file to center-align elements, color-code specific section background colors (orange, pink, light yellow), style navigation links, and format form buttons.

CODE EXPLANATION

The implementation comprises two primary components:

- **HTML Document (3.html):** Serves as the core template containing a centered main title, top navigation bar, welcome banner, menu list showcasing dishes with prices and images (Pizza, Burger, Ramen), table reservation form accepting user details and booking dates, operating hours, location details, and footer text.
- **CSS Stylesheet (style3.css):** Defines visual presentation including global center alignment, light yellow body background, custom banner colors (brown header, black navigation, orange home section, light pink menu block), form field padding, and custom green styling for the reservation submission button.

OUTPUT
